

Assignment 7 —
"Transdisciplinary Graduate Education"

Yingdan Huang

The most interesting concept I found in this article is "Boundary Objects". Since I have been wandering about an interdisciplinary land for quite some time, most ideas ring a bell with me occasionally – not from research point of view though, instead simply from my own experience as a person who happens to be attracted in some interdisciplinary studies. "Boundary objects" is interesting to me because I knew "fish-scale" and "boundary conditions" when I was working on geometric modeling and I didn't expect to see them in a discussion here! In this sense, the idea "Boundary objects" itself is transdisciplinary. I just feel it powerful when it offers a nice model or a new way to look at a totally different problem.

It is a summary paper with full citations and a long list in bibliography. I didn't not find any idea or concept that I disagree with.
